Keywords: de novo metagenome assembly from short sequence, de novo metagenome assembly, metagenomic, species genome, metagenome assembly, assembly of multiple genome, mixed sequence reads of multiple species, genome assembler, multiple genome, single genome, metagenome, genome, multiple species, mixed sequence read, microbial community, different species, de novo, conserved sequence, chimera contig, bruijn graph, mixed short read

Abstract

Motivation: An important step of "metagenomics" analysis is the assembly of multiple genomes from mixed sequence reads of multiple species in a microbial community. Most conventional pipelines employ a single-genome assembler with carefully optimized parameters and post-process the resulting scaffolds to correct assembly errors. Limitations of the use of a single-genome assembler for *de novo* metagenome assembly are that highly conserved sequences shared between different species often causes chimera contigs, and sequences of highly abundant species are likely mis-identified as repeats in a single genome.

Methods: We modified and extended a single-genome and de Bruijn-graph based assembler, **Velvet**, for *de novo* metagenome assembly. Our fundamental ideas are first decomposing de Bruijn graph constructed from mixed short reads into individual sub-graphs and second building scaffolds based on every decomposed de Bruijn sub-graph as isolate species genome.
