Protocol Citation: James Thornton Jr 2017. Assign taxonomy to gene calls using Centrifuge. **protocols.io** https://dx.doi.org/10.17504/protocols.io.kpfcvjn

Protocol status: Working

Created: November 07, 2017

Last Modified: March 01, 2018

Protocol Integer ID: 8647

Keywords: custom centrifuge pipeline, using centrifuge use, gene call, taxonomy, pipeline

Abstract

Uses a custom Centrifuge pipeline to assign taxonomy to gene calls.

1 Log into the HPC

Command

```
$ ssh hpc
$ ocelote
```

2 Move into your class directory.

Command

```
$ cd /rsgrps/bh_class/username
```

3 Clone the Centrifuge github repository.

Command

```
$ git clone git@github.com:jetjr/Centrifuge.git
```

4 Move into the Centrifuge directory.

Command

```
$ cd Centrifuge
```

Dependencies

5 This program uses R packages that must be installed prior to launching the job. Load the R module.

Command

```
$ module load unsupported
$ module load markb/R/3.1.1
```

6 Launch R.

Command

```
$ R
```

7 Get the "optparse" package.

8 Get ggplot2 and plyr packages. You may be prompted to select a mirror. Any US server will work.

Command

```
> install.packages(
```

Note

If you receive an error when installing the dependencies, continue with the protocol.

9 Quit the R session. Do not save workspace image.

Command

```
> q()
> Save workspace image? [y/n/c]: n
```

10 Edit the config.sh file to include the correct variable declarations. The following steps will detail how the config.sh file should be edited.

Command

```
$ nano config.sh
```

CENT_DB

11 export CENT_DB="/rsgrps/bh_class/b_compressed+h+v/b_compressed+h+v"

FASTA_DIR

12 export FASTA_DIR="/rsgrps/bh_class/username/prodigal"

Note

FASTA_DIR should point to the directory containing your nucleotides.fna file generated from step 2 and transfered to the anvio-genes directory.

TYPE

13 export TYPE="single"

FILE_EXT

14 export FILE_EXT="fna"

REPORT_DIR

15 export REPORT_DIR="/rsgrps/bh_class/username/taxonomy"

Note

The program will create this directory for you. Make sure to replace username.

PLOT_OUT

16 export PLOT_OUT='/rsgrps/bh_class/username/taxonomy/'

Note

Same as REPORT_DIR but make sure to include the trailing / as stated in the config.sh file.

PLOT_FILE and PLOT_TITLE

17 These should be named according to what sample your working with. For example, ocean data may name these:

export PLOT_FILE='ocean_depth'
export PLOT_TITLE='ocean_depth'

Note

PLOT FILE will be the file name of the bubble plot that is generated.

PLOT TITLE will be the title found on the actual plot.

FILE_TYPE

18 export FILE_TYPE="f"

Note

The nucleotides.fna file is in FASTA format.

EXCLUDE

19 The exclude parameter can be left blank.

export EXCLUDE=""

20 Save and quit config.sh

21 Submit the job using the submit script found in the Centrifuge directory.

Command

```
$ ./submit.sh
```

22 Status of the job can be determined by the following command:

Command

```
$ stat -u username
```
