Safety warnings

- ❗ We have trouble shot many conditions and found that tolerance glycerol concentration, BASTA concentration, and electroporation setting (pulse strength, number of cycles, duration of each cycle) vary with species. We also found that BASTA is powerful for killing dinoflagellate cells, but it also affects the viability of cells; therefore, we use "pulse-chase" approach to enhance viability while repressing growth of untransformed cells.

- 1 Cultivate *Fugacium kawagutii* (formerly *Symbiodinium kawagutii*) cells in L1 medium with an antibiotic cocktail for 3-4 weeks and *Alexandrium catenella* cells in L1 with antibiotics for 1-2 weeks. (Final antibiotic concentration is 0.1 mg/ml for Ampicillin, 0.05 mg/ml for Kanamycin and 0.05 mg/ml for Streptomycin).
- 2 Harvest cells by centrifugation at 800g for 5 min at 4°C.
- 3 For *F. kawagutii* cells, use 0.1M EDTA to resuspend the cell pellet, centrifuge at 800 g for 2 min at 4°C.
- 4 Wash cells with 10% Glycerol 3-4 times, centrifuge at 800 g for 2 min in 4°C.

Note

We also use 384mM D-sorbitol and it works well too.

- 5 Resuspend the pellet in 10% Glycerol with final cell concentration at 10^6 to 10^8 /ml.
- 6 Incubate ~40 μ l of cells with 5 μ l (~1 μ g) of DNA or with 5 μ l of 10 mM Tris-HCl (control) on ice for 5 min.
- 7 Put cells into a 0.2 cm cuvette, mix well with finger, electroporate using SHS (2.0 kV, 1 pulse), SC2 (1.5 kV, 1 pulse), or DIC (1.0 kV, 2 pulses, 1.0 msec) program with Bio-Rad MicroPulser 165-2100.
- 8 Add 1mL of L1 medium with antibiotics to the 0.2 cm cuvette, mix well, and transfer to a 1.5 mL tube, mix well and separate to different wells of a 12-well plate (with BASTA and without BASTA), add additional L1 medium with antibiotics to a total volume of 2 mL.
- 9 Incubate the 12 well plate in 25°C for *F. kawagutii* and 15°C for *A. catenella* for 24 hours.
- 10 Add BASTA to the final concentration of 0.5-0.67 mg/ml for *F. kawagutii* and 0.07-0.1 mg/ml for *A. catenella*.
- 11 Observe cells under normal and epifluorescent microscope in 1-3 days and continue to monitor for several weeks.
- 12 Plasmids designed and used for *F. kawagutii* and *A. catenella* were DinolII-*bsr*, DinolII-*pat*, the previously described DinolII-*gfp* (Sprecher et al., 2019), and vectors used in

previous studies (Ortiz-Matamoros et al., 2015a; Ortiz-Matamoros et al., 2015b)
