ABSTRACT

Summary

This protocol describes a protocol to evaluate histological fibrosis in mouse kidney.

Diabetic Complication:

Nephropathy

MATERIALS

- Picrosirius Red Stain Kit (1) Polysciences Inc Catalog #24901-250
- Anti Collagen antibody (1) Abcam Catalog #ab6586
- 70% 90% and 100% Ethanol Contributed by users
- PBS pH7.4 Contributed by users
- Xylene Contributed by users
- 10 % formalin Contributed by users
- Coverslips Contributed by users
- Staining Rack (2) Contributed by users

Note:

Abcam (RRID:SCR_012931)

Abcam Cat# ab6586, RRID:AB_305584

BEFORE START INSTRUCTIONS

Tissue Sampling

The mice were anesthetized and kidneys were perfused with PBS via left ventricle. The kidneys were resected, fixed with 10% formalin, and the median 50% in each kidney was subjected to paraffin section processing.

1 Tissue stain

a. picrosiriusred stain

Collagen including collagen II and III were stained with the Picrosirius Red Stain kit (Polysciences Inc., PA, US) according to the manufacturers’ protocol.¹

1. Dip in Xylene 5 min x 2 times
2. Dip in 100 % EtOH 5 min x 2 times
3. Dip in 90 % EtOH 5 min
4. Dip in 80 % EtOH 5 min
5. Dip in 70 % EtOH 5 min
6. Dip in 50 % EtOH 5 min

¹ protocols.io | https://dx.doi.org/10.17504/protocols.io.3gygjxw
7. PBS wash 5 min x 3 times
8. Solution A 2 min
9. PBS wash 5 min x 3 times
10. Solution B 60 min
11. Solution C 2 min
12. 70 % EtOH 45 sec
13. Dehydration, Cleaning, Mount

b. Collagen IV immunostain

For Collagen IV staining, slides were placed on the Bond Max immunohistochemistry (IHC) stainer (Leica Biosystems., IL, US). Antibodies against primary collagen IV (Abcam plc., Cambridge, UK) \(^2\) diluted 1:600 were applied to sections and incubated for one hour. All procedure was carried out at Translational Pathology Shared Resource at Vanderbilt University Medical Center.

2 Computational Quantification

The Bond Refine Polymer detection system (Leica Biosystems.) was used for visualization. Region of interest (ROI) was manually defined as cortical region, which is combined cortex and outer stripe of outer medulla (OSOM). The Picrosirius red- (red) and collagen IV-positive areas (dark) in cortex were calculated using image analysis software (Digital Image Hub; Leica Biosystems.) with unified threshold respectively. The regional fibrosis index was estimated by the area percentage of the positive pixels.

\[
\text{positive collagen 4} = \frac{\text{Area (Dark)}}{\text{Total Area}} \times 100\%
\]

\[
\text{positive picrosirius red} = \frac{\text{Area (Red)}}{\text{Total Area}} \times 100\%
\]

Analyses were performed for 6 - 7 sections of each kidney (12 – 14 sections per mouse).
