	SSIV Reverse Transcriptase Δ 1 μL Total Δ 20 μL
	Note
	A mastermix should be made up in the mastermix cabinet and added to the denatured RNA in the extraction and sample addition cabinet . Tubes should be wiped down when entering and leaving the mastermix cabinet.
5	Gently mix by pipetting and pulse spin the tube to collect liquid at the bottom of the tube.
-	
6	Incubate the reaction as follows:
	42 °C 00:50:00
	₿ 70 °C 🕑 00:10:00
	Hold at § 5 °C
7	If required resuspend lyophilised primers at a concentration of 100 μM each
	Note
	<u>nCov-2019/V2</u> primers for this protocol were designed using <u>Primal Scheme</u> and generate overlapping 400nt amplicons. Primer names and pools are listed in the .TSV file.
Drin	nor neal proparation
	ner pool preparation
8	Generate primer pool stocks by adding $\Delta 5 \mu L$ of each primer pair to a $\Delta 1.5 m L$ Eppendorf labelled either "Pool 1 (100 μ M)" or "Pool 2 (100 μ M)". Total volume should be

 $490 \ \mu L$ for Pool 1 (100 μ M) and $490 \ \mu L$ for Pool 2 (100 μ M). These are your

 $100 \mu M$ stocks of each primer pool.

Note

Primers should be diluted and pooled in the **mastermix cabinet** which should be cleaned with decontamination wipes and UV sterilised before and after use.

9 Dilute this primer pool 1:10 in molecular grade water, to generate 10µM primer stocks. It is recommend that multiple aliquots of each primer pool are made to in case of degradation or contamination.

Note

Primers need to be used at a final concentration of 0.015μ M per primer. In this case both pools have 98 primers in so the requirement is 3.6μ L primer pools (10uM) per 25μ L reaction. For other schemes, adjust the volume added appropriately.

Multiplex PCR

10 In the mastermix hood set up the multiplex PCR reactions as follows in 0.2mL 8-strip PCR tubes:

Component	Pool 1 Pool	2
5X Q5 Reaction Buffer	Δ 5 μL	Δ 5 μL
10 mM dNTPs	Δ 0.5 μL	Δ 0.5 μL
Q5 Hot Start DNA Polymerase	Δ 0.25 μL	Δ 0.25 μL
Primer Pool 1 or 2 (10µM)	Δ 3.6 μL	Δ 3.6 μL
Nuclease-free water	Δ 13.15 μL	Δ 13.15 μL
Total	👗 22.5 μL	👗 22.5 μL

	Note			
		CR strip tubes. Tu		up in the mastermix cabinet and viped down when entering and leaving
11	In the extraction a mix well by pipett	-	dition cabinet a	add $\boxed{2.5 \ \mu L}$ cDNA to each tube and
	Note			
	The extraction a decontaminatior			ld should be cleaned with and after use.
12	Pulse centrifuge t	he tubes to coll	ect the contents	s at the bottom of the tube.
13	Set-up the followi	ng program on	the thermal cyc	ler:
	- -			
	Step To	emperature T	ime	Cycles
	Heat Activation	\$ 98 °C	00:00:30	1
	Denaturation	₿ 98 °C	00:00:15	25-35
	Annealing	₿ 65 °C	00:05:00	25-35
	Hold	₿ 4 °C	Indefinite	1
	Note			
	Cycle number sh	iould be 25 for C	t 18-21 up to a m	naximum of 35 cycles for Ct 35

PCR clean-up

- 14 Combine the entire contents of "Pool 1" and "Pool 2" PCR reactions for each biological sample into to a single 📕 1.5 mL Eppendorf tube.
- 15 Clean-up the amplicons using the following protocol:

	Protocol
	NAME
	Amplicon clean-up using SPRI beads
	CREATED BY Josh Quick PREVIEW
	Note
	Amplicon clean-up should be performed in the post-PCR cabinet which should should be cleaned with decontamination wipes and UV sterilised before and after use.
15.1	
15.1	Vortex SPRI beads thoroughly to ensure they are well resuspended, the solution should be a homogenous brown colour.
	X Agencourt AMPure XP Beckman Coulter Catalog #A63880
15.2	Add an equal volume (1:1) of SPRI beads to the sample tube and mix gently by either flicking or pipetting. For example add $\boxed{4}$ 50 µL SPRI beads to a $\boxed{4}$ 50 µL reaction.
15.3	Pulse centrifuge to collect all liquid at the bottom of the tube.
15.4	Incubate for 👀 00:05:00 at room temperature.
15.5	Place on magnetic rack and incubate for 00:02:00 or until the beads have pelleted and the supernatant is completely clear.
15.6	Carefully remove and discard the supernatant, being careful not to touch the bead pellet.

15.7 Add <u>Δ 200 μL</u> of room-temperature [M] 70 % volume ethanol to the pellet.

- 15.8 Carefully remove and discard ethanol, being careful not to touch the bead pellet.
- 15.9 <u>go to step #15.7</u> and repeat ethanol wash.
- 15.10 Pulse centrifuge to collect all liquid at the bottom of the tube and carefully remove as much residual ethanol as possible using a P10 pipette.
- ^{15.11} With the tube lid open incubate for 00:01:00 or until the pellet loses it's shine (if the pellet dries completely it will crack and become difficult to resuspend).
- ^{15.12} Resuspend pellet in $\boxed{_30 \ \mu L}$ Elution Buffer (EB), mix gently by either flicking or pipetting and incubate for $\bigcirc 00:02:00$.

Elution Buffer (EB) Qiagen Catalog #19086

- 15.13 Place on magnet and transfer sample to a clean 1.5mL Eppendorf tube ensuring no beads are transferred into this tube.
- 15.14 Quantify Δ 1 μL product using the Quantus Fluorometer using the ONE dsDNA assay.

Quantification and normalisation

16 Quantify the amplicon pools using the Quantus Fluorometer using the ONE dsDNA assay.

NAME DNA quantification using the Quantus fluorometer CREATED BY Josh Quick PREVIEW Note It the concentration is greater than 25 ng/µL dilute the sample by a factor of 270µL 1∪mM Tris and quantify again using the Quantus fluorometer.	Protoco	51	
Josh Quick PREVIEW Note If the concentration is greater than 25 ng/µL dilute the sample by a factor of			antus fluorometer
If the concentration is greater than 25 ng/ μ L dilute the sample by a factor of			PREVIEW
	Note		

16.1	Remove Lambda DNA 400 ng/ μL standard from the freezer and leave on ice to thaw.
	Remove ONE dsDNA dye solution from the fridge and allow to come to room
	temperature.

🔀 QuantiFluor(R) ONE dsDNA System, 500rxn **Promega Catalog #**E4870

- 16.2 Set up two 📕 0.5 mL tubes for the calibration and label them 'Blank' and 'Standard'
- 16.3 Add $\boxed{I}_{200 \ \mu L}$ ONE dsDNA Dye solution to each tube.
- 16.4 Mix the Lambda DNA standard 400 ng/ μ L standard by pipetting then add $\underline{A} 1 \mu L$ to one of the standard tube.
- 16.5 Mix each sample vigorously by vortexing for 00:00:05 and pulse centrifuge to collect the liquid.
- 16.6 Allow both tubes to incubate at room temperature for 0.02:00 before proceeding.
- 16.7 Selection 'Calibrate' then 'ONE DNA' then place the blank sample in the reader then select 'Read Blank'. Now place the standard in the reader and select 'Read Std'.
- 16.8 Set up the required number of $_$ 0.5 mL tubes for the number of DNA samples to be quantified.

Note

Use only thin-wall, clear, 0.5mL PCR tubes such as Axygen #PCR-05-C

- 16.9 Label the tubes on the lids, avoid marking the sides of the tube as this could interfere with the sample reading.
- ^{16.10} Add $_$ 199 μ L ONE dsDNA dye solution to each tube.

16.11 Add $\Delta 1 \mu L$ of each user sample to the appropriate tube. Note Use a P2 pipette for highest accuracy. 16.12 Mix each sample vigorously by vortexing for 60 00:00:05 and pulse centrifuge to collect the liquid. 16.13 Allow all tubes to incubate at room temperature for (2) 00:02:00 before proceeding. 16.14 On the Home screen of the Quantus Fluorometer, select `Protocol`, then select `ONE DNA` as the assay type. Note If you have already performed a calibration for the selected assay you can continue, there is no need to perform repeat calibrations when using ONE DNA pre diluted dye solution. If you want to use the previous calibration, skip to step 11. Otherwise, continue with step 9. 16.15 On the home screen navigate to 'Sample Volume' and set it to $\Delta_{1 \mu L}$ then 'Units' and set it to $ng/\mu L$. 16.16 Load the first sample into the reader and close the lid. The sample concentration is automatically read when you close the lid. 16.17 Repeat step 16 until all samples have been read. 16.18 The value displayed on the screen is the dsDNA concentration in ng/µL, carefully record all results in a spreadsheet or laboratory notebook. 17 Label a 4 1.5 mL Eppendorf tube for each sample.

This is a 'one-pot ligation' protocol for native barcoded ligation libraries. We have seen no reduction in performance compared to standard libraries, and is made faster by using the Ultra II® ligation module which is compatible with the Ultra II® end repair/dA-tailing module removing a clean-up step.

18 Normalise the input by diluting each sample to $IMJ 5 ng/\mu L$. Use $\Delta IO \mu L$ input for

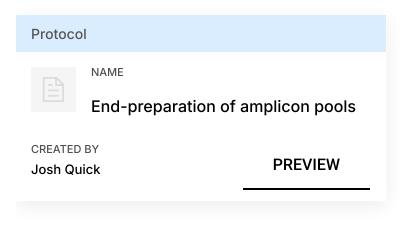

the end-preparation reaction to give a total input of 450 ng

Note

Input to the one-pot native barcoding reaction will vary depending on the amplicon length but we have determined 5ng is the correct input for efficient barcoding of this amplicon length. Process at least 7 samples plus one negative control per native barcoded library in order to have sufficient material at the end.

End-preparation

19 Perform end-preparation on the single amplicon pool using the Ultra II End Repair/dA-Tailing module

19.1 Set up the following reaction for each sample:

	Component	Volume
	DNA amplicons (5ng/ul)	Δ 10 μL
	Nuclease-free water	🗕 2.5 μL
	Ultra II End Prep Reaction Buffer	Δ 1.75 μL
	Ultra II End Prep Enzyme Mix	Δ 0.75 μL
	Total	Δ 15 μL
19.2	Incubate at room temperature for Incubate at 65 °C for 00000000000000000000000000000000000	
End-	preparation clean-up	
20	Clean-up end-preparation reaction $\boxed{4}$ 30 μ L Elution Buffer (EB)	n using a 1x volume of SPRI beads
	Protocol	
	Amplicon clean-up	using SPRI beads

AMX ligation

21 Perfom adapter ligation on the single amplicon pool with AMX.

A \/
ЛХ
PREVIEW

21.1 Set up the following AMX adapter ligation reaction:

Component	Volume
End-repaired amplicon pools	Δ 30 μL
Ligation Buffer (LNB)	Δ 10 μL
Adapter Mix (AMX)	Δ 5 μL
Quick T4 DNA Ligase	Δ 5 μL
Total	🐣 50 μL

Note

There will be some variation in clean-up efficiencies but expect to carry around 80% through a clean-up.

- 21.2 Incubate at room temperature for 🚫 00:10:00
- 21.3 Add $\underline{4}$ 50 μ L (1:1) of SPRI beads to the sample tube and mix gently by either flicking or pipetting.

Note

Vortex SPRI beads thoroughly before use to ensure they are well resuspended, the solution should be a homogenous brown colour.

- 21.4 Pulse centrifuge to collect all liquid at the bottom of the tube.
- 21.5 Incubate for 🚫 00:05:00 at room temperature.
- 21.6 Place on magnetic rack and incubate for 👀 00:02:00 or until the beads have pelleted and the supernatant is completely clear.

21.7 Carefully remove and discard the supernatant, being careful not to touch the bead pellet. 21.8 Add $\angle 250 \mu L$ SFB and resuspend beads completely by pipette mixing. Note SFB will remove excess adapter without damaging the adapter-protein complexes. Do not use 70% ethanol as in early clean-ups. 21.9 Pulse centrifuge to collect all liquid at the bottom of the tube. 21.10 Remove supernatant and discard. 21.11 Repeat steps 14-16 to perform a second SFB wash. 21.12 Pulse centrifuge and remove any residual SFB. Note You do not need to allow to air dry with SFB washes. 21.13 Add \angle 15 μ L EB and resuspend beads by pipette mixing. 21.14 Incubate at room temperature for 60 00:02:00 . 21.15 Place on magnetic rack. 21.16 Transfer final library to a new 1.5mL Eppendorf tube.

Libr	ary quantification
22	Quantify the final library using the Quantus Fluorometer using the ONE dsDNA assay.
	Protocol
	DNA quantification using the Quantus fluorometer
	CREATED BY Josh Quick PREVIEW
	Note
	Final library can be now be stored in 10 mM Tris pH 8 at 4°C for up to a week if needed otherwise proceed directly to MinION sequencing.
22.1	Remove Lambda DNA 400 ng/ μ L standard from the freezer and leave on ice to thaw. Remove ONE dsDNA dye solution from the fridge and allow to come to room temperature.

22.2	Set up two 20.5 mL tubes for the calibration and label them 'Blank' and 'Standard'
22.3	Add $\boxed{4}$ 200 μ L ONE dsDNA Dye solution to each tube.
22.4	Mix the Lambda DNA standard 400 ng/µL standard by pipetting then add $\boxed{21 \mu}$ to one of the standard tube.

- 22.5 Mix each sample vigorously by vortexing for 😒 00:00:05 and pulse centrifuge to collect the liquid.
- 22.6 Allow both tubes to incubate at room temperature for 🚫 00:02:00 before proceeding.
- 22.7 Selection 'Calibrate' then 'ONE DNA' then place the blank sample in the reader then select 'Read Blank'. Now place the standard in the reader and select 'Read Std'.
- 22.8 Set up the required number of $\boxed{_0.5 \text{ mL}}$ tubes for the number of DNA samples to be quantified.

Use only thin-wall, clear, 0.5mL PCR tubes such as Axygen #PCR-05-C

- 22.9 Label the tubes on the lids, avoid marking the sides of the tube as this could interfere with the sample reading.
- 22.10 Add $\boxed{-199 \ \mu L}$ ONE dsDNA dye solution to each tube.
- 22.11 Add $\boxed{1}$ µL of each user sample to the appropriate tube.

Note

Use a P2 pipette for highest accuracy.

- 22.12 Mix each sample vigorously by vortexing for 😒 00:00:05 and pulse centrifuge to collect the liquid.
- Allow all tubes to incubate at room temperature for 00:02:00 before proceeding.

22.14	On the Home screen of the Quantus Fluorometer, select 'Protocol', then select 'ONE
	DNA` as the assay type.

If you have already performed a calibration for the selected assay you can continue, there is no need to perform repeat calibrations when using ONE DNA pre diluted dye solution. If you want to use the previous calibration, skip to step 11. Otherwise, continue with step 9.

- ^{22.15} On the home screen navigate to 'Sample Volume' and set it to $_1 \mu L$ then 'Units' and set it to ng/ μL .
- 22.16 Load the first sample into the reader and close the lid. The sample concentration is automatically read when you close the lid.
- 22.17 Repeat step 16 until all samples have been read.
- 22.18 The value displayed on the screen is the dsDNA concentration in ng/ μ L, carefully record all results in a spreadsheet or laboratory notebook.

MinION sequencing

23 Prime the flowcell and load 4 20 ng sequencing library onto the flowcell.

Protoco	ol
B	NAME Priming and loading a MinION flowcell
CREATED Josh Qu	

	Note
	From experience we know 20 ng is optimum loading input for short amplicons.
23.1	Thaw the following reagents at room temperature before placing on ice:
	Sequencing buffer (SQB) Loading beads (LB) Flush buffer (FLB) Flush tether (FLT)
23.2	Add $\boxed{4}$ 30 μ L FLT to the FLB tube and mix well by vortexing.
23.3	If required place a new MinION flowcell onto the MinION by flipping open the lip and pushing one end of the flowcell under the clip and pushing down gently.
23.4	Rotate the inlet port cover clockwise by 90° so that the priming port is visible.
23.5	Take a P1000 pipette and tip and set the volume to $4800 \ \mu$ L. Place the tip in the inlet port and holding perpendicularly to the plane of the flowell remove any air from the inlet port by turning the volume dial anti-clockwise.
	Note
	Be careful not to remove so much volume that air is introduced onto the rectangular array via the outlet.
23.6	Load $\boxed{4}$ 800 µL of FLB (plus FLT) into the flow cell via the inlet port, dispense slowly and smoothly trying to avoid the introduction of any air bubbles.
23.7	Wait for 👀 00:05:00 .
23.8	Gently lift the SpotON cover to open the SpotON port.

- 23.9 Load another $\underline{\square}$ 200 μ L of FLB (plus FLT) into the flow cell via the inlet port, this will initiate a siphon at the SpotON port to allow you to load the library dilution.
- 23.10 In a new tube prepare the library dilution for sequencing:

Component	Volume
SQB	Δ 37.5 μL
LB	Δ 25.5 μL
Final library	Δ 12 μL
Total	Δ 75 μL

Mix LB immediately before use as they settle quickly.

Dilute library in EB if required.

- 23.11 Mix the prepared library gently by pipetting up and down just prior to loading.
- ^{23.12} Add the $\boxed{_}$ 75 μ L library dilution to the flow cell via the SpotON sample port in a dropwise fashion. Ensure each drop siphons into the port before adding the next.
- 23.13 Gently replace the SpotON sample port cover, making sure the bung enters the SpotON port, close the inlet port and close the MinION lid.
- 24 Start the sequencing run using MinKNOW.

	Protocol		
	NAME		
		encing run using MinKNOW	
	CREATED BY Josh Quick	PREVIEW	
24.1	If required plug the MinION into the co detected.	omputer and wait for the MinION ar	าd flowcell
24.2	Choose flow cell 'FLO-MIN106' from t	he drop-down menu.	
24.3	Then select the flowcell so a tick appe	ears.	
24.4	Click the 'New Experiment' button in t	he bottom left of the screen.	
24.5	On the New experiment popup screen experiment from the individual tabs:	n, select the running parameters for	r your
	Experiment: Name the run in the expe	eriment field, leave the sample field	d blank.
	Kit: Selection: Select LSK109 as there	e is no option for native barcoding	(NBD104).
	Run Options: Set the run length to 6 h been collected as determined using R		ufficient d
	Basecalling: Leave basecalling turned	d but select 'fast basecalling'.	
	Output: The number of files that Mink set to 4000 but can be reduced to ma	-	-
	Click 'Start run'.		

24.6 Monitor the progress of the run using the MinKNOW interface.
