ABSTRACT
Radiolaria are protists which can't be cultivated. These microorganisms have to be isolated by single-cell for genetic identification and it can be difficult to get clean DNA. Here we optimized a DNA extraction protocol from protist single-cell. It works very well on single-cell Radiolaria, Foraminifers, but also Ciliates, Dinoflagelletes, Diatoms.

MATERIALS TEXT

Material and Equipment:

- Glass bent micropipettes.
- Silicone Tubing (Cole-Parmer, Tube silicone platinium LS T17 ref. FV-96410-17)
- StereoMicroscope or binocular microscope.
- Petridishes Diameter 70mm.
- Centrifuge 5417R (Eppendorf)
- Thermomixer Eppendorf

Kit, Reagents and Chemicals:

- **MasterPure Complete DNA and RNA purification** (Epicenter Illumina, ref MC85200)
  Enzymes (Proteinase K, RNase, DNase) are stored at -20°C
  Other reagents from the kit are stored at room temperature.

- Ethanol absolute, molecular biology quality.
- Propan-2-ol quality molecular biology.
- 0.22µm filtered seawater or artificial seawater.
- Ice for enzyme storage during labwork.

SAFETY WARNINGS

Wear labcoat, gloves.

BEFORE STARTING

Prepare Ethanol 70% from absolute Ethanol: Mix 35 mL of absolute Ethanol with 15 mL nuclease-free water in a Falcon 50mL Store at -20°C.

1. Cell Isolation

1. Isolate individually protist cells (at least 50µm in length) using a glass bent micropipette under a binocular microscope.

2. Wash each cell in three successive baths of 0.22µm-filtered and sterile seawater.

3. Transfer subsequently cells in a 1.5mL sterile microtube.

4. Add 30 µL of lysis buffer (Tissue and Cell Lysis Solution from MasterPureTM DNA and RNA Purification Kit, Epicenter) and store at -20°C for barcoding treatment / -80°C for meta-omics treatment.

2. Cell lysis

5. Pellet cells by centrifugation (2 min at Vmax), throw the supernatant, let ~25-30 µL of liquid.

6. Dilute 1 µL of Proteinase K in 300 µL de lysis solution Tissue et Cellule for each sample. Vortex 10 sec for resuspending cells (facultative).

7 Add 300 µL of mix Proteinase K + lysis solution Tissue et Cellule in each sample. Vortex.

8 Incubate 15 min at 65°C, 1000 rpm. Put samples in ice 3-5 min.

3. Total nucleic acids precipitation

9 Add 150 µL MPC reagent to 300 µL of lysed sample. Vortex.

A+ 500 µL Propan-2-ol. Mix per inversion.
5-
6 7+ 500 µL d’EtOH 70%. Don’t vortex, mix gently the support. Spin 5min at Vmax ;at 12°C.
8-Discard a maximum of supernatant with precaution, without touching the pellet.
9-Let dry 5-10 min at RT.
10-

10 Spin 10 min at 11 000 g, 12°C. If there is no pellet, add more 25 µL MPC buffer and spin again 10 min at 11 000 g, 12°C.

11 Transfer the supernatant ion a new clean microtube (1.5 mL), discard the pellet.
(To keep the squeletton, keep the tube with the pellet, add 500 µL MilliQ Water and store at -20°C).

12 Add 500 µL of Isopropanol. Mix per inversion. Spin 10min at Vmax, 12°C.

13 Discard the supernatant with precaution, without touching the pellet.

14 Add 500 µL of Ethanol 70%. Don’t vortex, mix gently the support. Spin 5min at Vmax ;at 12°C.

15 Discard a maximum of supernatant with precaution, without touching the pellet.

16 Let dry 5-10 min at room temperature.

17 Elute in 25 µL of TE1x buffer.
Vortex and spin shortly.
Store at -80°C.
