Protocol Citation: Magdalena M Julkowska 2019. ROS staining for Arabidopsis (green fluorescent stain). **protocols.io** **https://dx.doi.org/10.17504/protocols.io.zksf4we**

Protocol status: Working
We use this protocol and it's working

Created: March 29, 2019

Last Modified: March 29, 2019

Protocol Integer ID: 21874

Keywords: ROS, Arabidopsis, fluorescent stain

Abstract

This protocol is adapted from two publications describing fluorescent staining for ROS - **Shin et al., 2005** and **Orman-Ligeza et al. 2016** (citing Shin)

Materials

MATERIALS

Murashige & Skoog medium including B5 vitamins **Duchefa Biochemie Catalog #**M0231

Costar® 6 Well Clear TC-Treated Multiple Well Plates, Individually Wrapped, Sterile **Westnet Catalog #**3516

CM-H2DCFDA **Thermo Fisher Scientific Catalog #**C6827

Before start

prepare sterile MS medium:
- 1/2 MS
- 0.5% sucrose
- 0.1% MES buffer
- pH 5.8 with KOH

Autoclave

prepare CM-H2DCFDA according to the supplier instructions

1 Sterilize the seedlings, germinate and transfer to for e.g. salt stress medium as described in the "Quantification of salt-induced changes in Root System Architecture in Arabidopsis" protocol - **dx.doi.org/10.17504/protocols.io.zkqf4vw**

2 Transfer the seedlings from agar plates into nutrient solution that is the same as agar plate composition (but without Dashin agar). You can use 24/12/6 well-plates - this will depend on your final seedlings size

3 After transferring the seedlings to liquid medium add DCF-DA so that the final concentration of the DCF-DA in the incubation medium is 50 uM

4 Wrap the well plate in aluminium foil (DCF-DA is light sensitive) and let the samples incubate for 30 min with gentle shaking.

5 Wash the seedlings with medium without DCF-DA

6 Image the stain using fluorescence microscopy:
- 460–500 nm bandpass excitation
- 510– 560 nm bandpass emission
