ABSTRACT

Objective To evaluate the improvement of survival rate for patients after cardiopulmonary resuscitation (CPR) by Shenfu Injection. Method Electronic databases including Medline, Embase, Web of Science, Cochrane Central Register of Controlled Trial, Wanfang Database, and VIP Database were searched with the search terms of "Shenfu Injection", "cardiopulmonary resuscitation", "randomized controlled trials" and their synonyms. A funnel plot was adopted to evaluate publication bias. The meta-analysis was performed using a fixed effects model in case of low heterogeneity and a randomized effects model in case of high heterogeneity. Conclusion Add on treatment of Shenfu Injection may improve the survival rate of the patients after CPR.
