ABSTRACT

Background: Chronic spontaneous urticaria (CSU) is a mast cell-driven disease with impaired quality of life. Some drugs, especially antibiotics for *Helicobacter pylori* (*H. pylori*) eradication and a sulfone antibiotic, dapsone, may be the candidates for treatment at CSU. The purpose of the study will be to assess the efficacy of the antibiotic therapies on CSU.

Methods: Databases (MEDLINE, the Cochrane Central Register of Controlled Trials, EMBASE, the World Health Organization International Clinical Trials Platform Search Portal and ClinicalTrials.gov) will be searched. Study selection, data abstraction and quality assessment will be independently performed using Grading of Recommendations Assessment, Development and Evaluation approach. The outcomes will be remission of CSU-related symptoms, activities, and adverse events by antibiotics for *H. pylori* eradication or dapsone.
