ABSTRACT

Human Tumor Atlas Tissue MicroArray TNP (TMA-TNP)

The Tissue MicroArray (TMA) TNP will extend the SARDANA-TNP characterization and analytics methodologies for evaluation and validation on a large array of breast tumor samples that provide a broad spectrum of disease state and subtype. A commercially available anonymized breast tumor TMA was purchased and sections distributed to participating HTAN Centers. Some deidentified basic clinical data will also be provided. The participating HTAN Centers will characterize the FFPE specimens (e.g. by imaging) and generate a spatially resolved cell type/state census using each Center's method of choice. Data will then be recorded in a common repository to enable joint analysis.

This TNP has two specific Aims focused on (i) Data Collection and (ii) Data Coordination and Analysis. Individual Centers can participate in one or both aims.

This protocol outlines the design of the TMAs and provides the basic clinical sample descriptions.

TMA Map of Participant IDs

- 1 A custom breast TMA design generated by Dr. Koei Chin (OHSU) was sent to Pantomics for TMA FFPE block generation and sectioning. The randomized array design, outlined below, was used to generate 2 identical TMAs, TMA1 and TMA2. Cores from tumor samples with Pantomics Ref. No. were arrayed as shown (the matching HTAN Participant IDs are also shown).
